QUESTIONS

- 1) What is your probable diagnosis?**
- 2) What is the cause?**
- 3) Elaborate upon the immunologic mechanism involved.**
- 4) Describe your treatment plan.**

FLUOROSIS

45 year old man came with multiple joints pain from a rural district in Andhra Pradesh./whose place is near to irrigation dams. On examination

Genu valgum present.

X-ray revealed Osteoporosis and osteosclerosis.

1. What is your probable diagnosis?
2. What is the toxic level of the compound?
3. What are the places the disorder is commonly found?
4. What is the staple diet in which the compound is present? What are the sources?

MYOCARDIAL INFARCTION

A 54-year-old employee of a hospital developed breathlessness soon after his lunch. He also complained of dizziness. His blood pressure was 110/70 (previously 170/100). No chest pain.

Biochemical findings:

CK-MB level was increased

Troponin T level increased

1. What is your probable diagnosis?
2. What is normal CK-MB level?
3. What is troponin I?
4. What would be his LDH level?

Early Clinical Exposure-IV

Mrs. Maria is a 32-year-old white woman, working as assistant operation manager in manufacturing cotton unit, presents with symptoms of recurrent abdominal pain and loose stools. She states that she has experienced these symptoms since adolescence, with periods of improvement and worsening over the years. She notes that her symptoms were most pronounced when she was in college. Over the past year, her symptoms have been occurring more frequently and with greater severity. Bloating and distention also have increasingly bothered her over the past 6 months. The bloating seems to worsen with food intake, while the distention progresses throughout the day. When questioned about abdominal pain, she describes it as 7 (on a scale of 10), with acute worsening immediately prior to defecation and significant improvement after defecation. She has loose stools approximately one third of the time and often will have 2-3 bowel movements per day. She jogs about a kilometer once in week, tries to eat 4-6 servings of fruits and vegetables daily, and taking a daily multivitamin, for many years. She feels that she is losing weight but her vital signs seems to be within normal limits: height 5'6", weight 46 kg, blood pressure 108/64 mm Hg, pulse 60 beats per minute, and respiratory rate 12 breaths per minute. On physical examination, she is a well-developed, well-nourished woman but exhibit some employment distress. Her physical examination is notable for mild tenderness to palpation in the left lower quadrant, but there is no rebound tenderness, guarding, or other peritoneal signs. The remainder of the physical examination is unremarkable.

About 5 years back, she presented to the emergency room complaining that she had vomited up blood at home. She had been suffering with sharp epigastric pain, especially in the morning, for one week before the vomiting began. The pain was accompanied by mild nausea and was relieved by food or antacids. She had a long history of peptic ulcer disease and was initially diagnosed with duodenal ulcer at age of 16. Despite at least six discrete episodes of ulcer documented by x-ray or endoscopy, she had never undergone surgery. The physician had worked up for Zollinger-Ellison syndrome, which was negative. Her endoscopy findings revealed scarring of the pylorus with a 2 cm ulcer in the first portion of the duodenum. Biopsy of the ulcer revealed curved bacilli with Warthin--Starry silver staining and a positive urease test. She was started on an H₂ blocker and the pain rapidly subsided.

1. Describe the clinical features of irritable bowel syndrome and duodenal ulcer.
2. Compare and contrast the irritable bowel syndrome and inflammatory bowel disease.
3. Explain the gut-brain axis [GBA]. Explain the role GBA in GI disorder.
4. Explain the feature of Gastric Mucosal barrier and its function.
5. Explain the neuronal mechanism of Gastro-iliac reflex and enterogastric reflex.
6. Explain the mechanism of nausea and vomiting.
7. Describe the pathophysiology of Zollinger-Ellison syndrome and its management.
8. What phenotypic characteristics of *H. pylori* are thought to account for its virulence? Which of them appear to be most important?
9. What further treatment might be helpful? What long-term benefits could she expect if she were to receive the additional treatment?
10. Describe mechanism of defecation reflex.
