## POSTER PRESENTATION BY PG IN CONFERENCE

**DETECTION OF METALLO BETA LACTAMASE PRODUCING PSEUDOMONAS AERUGINOSA IN HOSPITALISED PATIENTS**  
Dr Kavita Ahire, Dr V M Bhat, Dr Varsha Kalshetti, Mr M R Afsar, Mr S T Bothkar, Mr N Chavhan,  
Department Of Microbiology, JMF's A C P M Medical College, Dhule.

**Introduction:** *Pseudomonas* is the epitome of opportunistic nosocomial pathogens which causes wide spectrum of infections and leads to substantial morbidity. Metallo beta lactamase(MBL) producing *pseudomonas* has become increasingly recognised as the aetiological agent in variety of serious infections in hospitalized patients. Spread of MBL genes among bacterial pathogens is a matter of concern with regard to the future antimicrobial therapy.

**Aim:** To determine the incidence of metallo beta lactamase producing *Pseudomonas aeruginosa* in hospitalized patients.

**MATERIALS AND METHODS**

The study was carried out for a period of six months from Dec 2011 to May 2012 on 187 strains which were identified as *P. aeruginosa* by conventional methods. These isolates were subjected to susceptibility testing to antipseudomonal drugs by the disk diffusion method according to the Clinical Laboratory Standards Institute (CLSI) guidelines. Impenem non-susceptible isolates were investigated for MBL production by Impenem-EDTA combined disk method. An increase of seven mm or more in the zone diameter for Impenem + EDTA disk in compare with Impenem disk was considered as a MBL producing isolate. *Pseudomonas ATCC27853* was used as a control strain.

**Result**

Of the 187 *Pseudomonas aeruginosa* isolates 20(10.6%) were Impenem resistant and 14(13.3%) were found to be MBL producers. MBL positive isolates showed high resistance to all tested antibiotics.

**DISCUSSION**

In our study 10.6% of isolates were resistant to Impenem, this finding is relatively in agreement with previous studies done by Miss Susheel Jaiswal et al(1) which reported 21% Impenem resistance.

Incidence of MBL production in *P. aeruginosa* has been reported to be 10-30% from various clinical specimens across the country(4) We found 13.06% MBL production in *P. aeruginosa* and 100% of them were multi drug resistant isolates. these findings are in accordance with results obtained by Mujumdar et al.(5) (2005).

Several phenotypic methods, available for the detection of MBL-producing bacteria are based on the ability of metal chelators, such as EDTA and thiol-based compounds, to inhibit the activity of MBLs. While most of these tests are technically demanding, expensive, time-consuming, and often subjective to interpret, (2) Impenem EDTA combined disk method is a much simpler test sanctioned by the CLSI.(3)

**Conclusion:** Infection caused by Multiple resistant *Pseudomonas* have been associated with increased morbidity, mortality and costs. As infections caused by such strains especially metallo beta lactamase producing *P. aeruginosa* are particularly challenging, it necessitates the implementation of not just surveillance studies but also proper and judicious selection of antibiotics to prevent the spread of resistance and to provide optimum treatment for critically ill patients.

### CASE PRESENTATION BY PG IN MAPCON

#### FCASE HISTORIES: MAPCON 2021

Mapcon no.	Category	Ref no/ institution	Case
1	Breast	Sknmc & gh pune case 3 (for discussion )	57 year male with retro areolar lump since 1 year.
2	Breast	Dmh, path lab Case 1	34 yrs female. Enlarged nipple in 2017, clinical impression – paget’s disease. Hpe done outside – seborrhoeic keratosis. Mammography done in 2017 showed no lesion in the breast parenchyma. Received wide local excision of the nipple areola complex. Gross examination showed growth over nipple areola measuring 4 x 3.5 x 2 cm. Nipple is not visible separately from the growth. Cut surface is tan grey, firm and irregular. Section from nipple areola complex is submitted.
3	Breast	Srtr gmc case 2	61 yr old male case of right breast lump since 2yrs. Fnac was suggestive of malignant lesion. Gross: received right mrm specimen measuring mass of 6.5 x 3.5 x 2 cm seen involving upper outer quadrant. H& e section from grayish white mass provided.
4	Breast	Nssh case 1	Section from the breast mass. Specimen: left breast mass in an 28 yr old female. Gross: encapsulated nodular mass measuring 17 x 17 x 5 cm. The cut surface is soft to firm, whitish with few interspersed yellow areas. Ct scan: a well defined heterogeneous density lesion is identified virtually replacing the entire left breast parenchyma.

21	Female reproductive	Srl ltd case 2	53 year female presenting with lower abdominal pain and fever. Ct abdomen pelvis: right adnexal mass measuring 5 x 4 x 3 cm. Total abdominal hysterectomy with bso done. Cut surface of right ovarian mass: solid cystic. Cut surface of endometrium and cervix is unremarkable. Cut surface of left ovary is unremarkable. Cut surface of bilateral fallopian tubes is unremarkable. One h&e slide of right ovarian mass provided.
22	Female reproductive	Pcmc pgi ycmh pimpri Case 1	A 40 yr old female came with complaints of abnormal uterine bleeding.usg suggested uterine fibroid of size 7 x 6 x 4 cm. Received total hysterectomy specimen with bilateral salpingoophorectomy, with separately sent fairly circumscribed mass of size 6.5 x 5 x 3.5 cm, grey white round to oval. On c/s it shows yellowish white mass with trabeculated appearance and few areas of hemorrhage. 1 h&e stained slide from mass provided.
23	Female reproductive	Acpmmc case 2	History: 30 yrs female case of pain abdomen and amenorrhea since 1 yr. P/s foul smelling white discharge present. Cervix and vagina healthy. P/v uterus retroverted and bulky. Right fornix – mass of 5 x 5 cm palpable, mobile, non – tender. Gross: salpingo - oophorectomy specimen received. Cut section of the ovary showed lobulated mass, yellow orange in colour with few small cystic dilations separated with fibrous septae.
24	Female reproductive	Dypmc case 2	43 yr old female with complaints of abdominal pain vaginal bleeding and irregular menstruation. On usg- free pelvic fluid suggestive of ascites noted. Hysterectomy with bso was done and sent for hpe. Gross: uterus was atrophic measuring 3.5 x 2 x 2 cm. Both ovaries were slightly enlarged. Section from left ovary provided.
25	Female reproductive	Dyp mumbai case 1	Placenta of 28 yr old primi iugr. Gross: placenta measuring 20 x 12 x 4 cm. Cut surface: hemorrhagic areas seen.
